ning of each regular issue of the PCT Gazette.

(54) Title: PROCESS FOR THE FERMENTATIVE PREPARATION OF L-THREONINE

(57) Abstract: The invention provides a process for the fermentative preparation of L-threonine using Enterobacteriaceae which in particular already produce L-threonine and in which the nucleotide sequence(s) of coryneform bacteria which code(s) for the thrE gene are enhanced, in particular over-expressed.

Process for the fermentative preparation of L-threonine

This invention relates to a process for the fermentative preparation of L-threonine using Enterobacteriaceae in which the thrE gene of coryneform bacteria is enhanced.

5 Prior art

L-Threonine is used in animal nutrition, in human medicine and in the pharmaceuticals industry. It is known that L-threonine can be prepared by fermentation of strains of Enterobacteriaceae, in particular Escherichia coli and
10 Serratia marcescens. Because of their great importance, work is constantly being undertaken to improve the preparation processes. Improvements to the process can relate to fermentation measures, such as e.g. stirring and supply of oxygen, or the composition of the nutrient media,
15 such as e.g. the sugar concentration during the fermentation, or the working up to the product form, by e.g. ion exchange chromatography, or the intrinsic output properties of the microorganism itself.

Methods of mutagenesis, selection and mutant selection are
20 used to improve the output properties of these microorganisms. Strains which are resistant to antimetabolites, such as e.g. the threonine analogue α -amino- β -hydroxyvaleric acid (AHV), or are auxotrophic for amino acids of regulatory importance and produce L-
25 threonine are obtained in this manner.

Methods of the recombinant DNA technique have also been employed for some years for improving the strain of Enterobacteriaceae strains which produce L-threonine, by amplifying individual threonine biosynthesis genes and
30 investigating the effect on the L-threonine production.

Object of the invention

The inventors had the object of providing new measures for improved fermentative preparation of L-threonine.

Description of the invention

5 The invention provides a process for the fermentative preparation of L-threonine using Enterobacteriaceae which in particular already produce L-threonine and in which the nucleotide sequence(s) of coryneform bacteria which code(s) for the thrE gene are enhanced, in particular over-
10 expressed.

In particular, the process is a process for the preparation of L-threonine, which comprises carrying out the following steps:

- 15 a) fermentation of microorganisms of the family Enterobacteriaceae in which at least the thrE gene of coryneform bacteria is enhanced (over-expressed), optionally in combination with further genes,
- b) concentration of the L-threonine in the medium or in the cells of the microorganisms of the family
20 Enterobacteriaceae, and
- c) isolation of the L-threonine.

The term "enhancement" in this connection describes the increase in the intracellular activity of one or more enzymes or proteins in a microorganism which are coded by
25 the corresponding DNA, for example by increasing the number of copies of the gene or genes, using a potent promoter or a gene which codes for a corresponding enzyme or protein with a high activity, and optionally combining these measures.

30 The microorganisms which the present invention provides can prepare L-threonine from glucose, sucrose, lactose, fructose, maltose, molasses, starch, cellulose or from

glycerol and ethanol. They are representatives of Enterobacteriaceae, in particular of the genera Escherichia and Serratia. Of the genus Escherichia the species Escherichia coli and of the genus Serratia the species

5 Serratia marcescens are to be mentioned in particular.

Suitable L-threonine-producing strains of the genus Escherichia, in particular of the species Escherichia coli, are, for example

Escherichia coli TF427
10 Escherichia coli H4578
Escherichia coli KY10935
Escherichia coli VNIIGenetika MG-442
Escherichia coli VNIIGenetika M1
Escherichia coli VNIIGenetika 472T23
15 Escherichia coli BKIIM B-3996
Escherichia coli kat 13
Escherichia coli KCCM-10132

Suitable L-threonine-producing strains of the genus Serratia, in particular of the species Serratia marcescens,

20 are, for example

Serratia marcescens HNr21
Serratia marcescens TLr156
Serratia marcescens T2000

It has been found that Enterobacteriaceae produce L-

25 threonine in an improved manner after over-expression of the thrE gene of coryneform bacteria which codes for threonine export.

Nucleotide sequences of the thrE gene of coryneform bacteria are shown in SEQ ID No 1 and SEQ ID No 3 and the

30 resulting amino acid sequences of the export proteins are shown in SEQ ID No 2 and SEQ ID No 4.

The thrE gene shown in SEQ ID No 1 and SEQ ID No 3 can be used according to the invention. Alleles of the thrE gene of coryneform bacteria which result from the degeneracy of

the genetic code or due to sense mutations of neutral function can furthermore be used.

To achieve an over-expression, the number of copies of the corresponding genes can be increased, or the promoter and regulation region or the ribosome binding site upstream of the structural gene can be mutated. Expression cassettes which are incorporated upstream of the structural gene act in the same way. By inducible promoters, it is additionally possible to increase the expression in the course of fermentative L-threonine production. The expression is likewise improved by measures to prolong the life of the m-RNA. Furthermore, the enzyme activity is also increased by preventing the degradation of the enzyme protein. The genes or gene constructions can either be present in plasmids with a varying number of copies, or can be integrated and amplified in the chromosome. Alternatively, an over-expression of the genes in question can furthermore be achieved by changing the composition of the media and the culture procedure.

Instructions in this context can be found by the expert, inter alia, in Chang and Cohen (Journal of Bacteriology 134:1141-1156 (1978)), in Hartley and Gregori (Gene 13:347-353 (1981)), in Amann and Brosius (Gene 40:183-190 (1985)), in de Broer et al. (Proceedings of the National of Sciences of the United States of America 80:21-25 (1983)), in LaVallie et al. (BIO/TECHNOLOGY 11, 187-193 (1993)), in PCT/US97/13359, in Llosa et al. (Plasmid 26:222-224 (1991)), in Quandt and Klipp (Gene 80:161-169 (1989)), in Hamilton (Journal of Bacteriology 171:4617-4622 (1989)), in Jensen and Hammer (Biotechnology and Bioengineering 58, 191-195 (1998) and in known textbooks of genetics and molecular biology.

Plasmid vectors which are capable of replication in Enterobacteriaceae, such as e.g. cloning vectors derived from pACYC184 (Bartolomé et al.; Gene 102, 73-78 (1991)), pTrc99A (Amann et al.; Gene 10:211-216 (1981)), or p1111

derivatives (Vocke and Bastia, Proceedings of the National Academy of Science USA 80 (21):6557-6561 (1983)) can be used. A strain transformed with a plasmid vector where the plasmid vector carries the nucleotide sequence which codes
5 for the thrE gene of coryneform bacteria can be employed in a process according to the invention.

In addition, it may be advantageous for the production of L-threonine with strains of the family Enterobacteriaceae to over-express one or more enzymes of the known threonine
10 biosynthesis pathway or enzymes of anaplerotic metabolism or enzymes for the production of reduced nicotinamide adenine dinucleotide phosphate, in addition to the thrE gene of coryneform bacteria. Thus, for example

- at the same time the thrABC operon which codes for
15 aspartate kinase, homoserine dehydrogenase, homoserine kinase and threonine synthase (US-A-4,278,765), or
- at the same time the pyc gene which codes for pyruvate carboxylase (DE-A-19 831 609), or
- at the same time the pps gene which codes for
20 phosphoenol pyruvate synthase (Molecular and General Genetics 231:332 (1992)), or
- at the same time the ppc gene which codes for phosphoenol pyruvate carboxylase (Gene 31:279-283 (1984)), or
- 25 • at the same time the genes pntA and pntB which code for transhydrogenase (European Journal of Biochemistry 158:647-653 (1986)), or
- at the same time the gdhA gene which codes for glutamate dehydrogenase (Gene 27:193-199 (1984)), or
- 30 • at the same time the rhtB gene which imparts L-homoserine resistance (EP-A-0994190)

can be obtained in particular from the following:

In addition to over-expression of the thrE gene it may furthermore be advantageous, for the production of L-threonine, to eliminate undesirable side reactions, such as e.g. threonine dehydrogenase (Nakayama: "Breeding of Amino
5 Acid Producing Microorganisms", in: Overproduction of Microbial Products, Krumphanzl, Sikyta, Vanek (eds.), Academic Press, London, UK, 1982 and Bell and Turner, Biochemical Journal 156, 449-458 (1976)). Bacteria in
10 L-threonine are at least partly eliminated can be employed in the process according to the invention.

The microorganisms produced according to the invention can be cultured in the batch process (batch culture) or in the fed batch process (feed process). A summary of known
15 culture methods is described in the textbook by Chmiel (Bioprozesstechnik 1. Einführung in die Bioverfahrenstechnik [Bioprocess Technology 1. Introduction to Bioprocess Technology (Gustav Fischer Verlag, Stuttgart, 1991)) or in the textbook by Storhas (Bioreaktoren und
20 periphere Einrichtungen [Bioreactors and Peripheral Equipment] (Vieweg Verlag, Braunschweig/Wiesbaden, 1994)).

The culture medium to be used must meet the requirements of the particular strains in a suitable manner. Descriptions of culture media for various microorganisms are contained
25 in the handbook "Manual of Methods for General Bacteriology" of the American Society for Bacteriology (Washington D.C., USA, 1981). Sugars and carbohydrates, such as e.g. glucose, sucrose, lactose, fructose, maltose, molasses, starch and cellulose, oils and fats, such as e.g.
30 soya oil, sunflower oil, groundnut oil and coconut fat, fatty acids, such as e.g. palmitic acid, stearic acid and linoleic acid, alcohols, such as e.g. glycerol and ethanol, and organic acids, such as e.g. acetic acid, can be used as the source of carbon. These substance can be used
35 individually or as a mixture. Organic nitrogen-containing compounds, such as peptones, yeast extract, meat extract, malt extract, corn steep liquor, soya bean flour and urea,

or inorganic compounds, such as ammonium sulphate, ammonium chloride, ammonium phosphate, ammonium carbonate and ammonium nitrate, can be used as the source of nitrogen. The sources of nitrogen can be used individually or as a
5 mixture. Phosphoric acid, potassium dihydrogen phosphate or dipotassium hydrogen phosphate or the corresponding sodium-containing salts can be used as the source of phosphorus. The culture medium must furthermore comprise salts of metals, such as e.g. magnesium sulfate or iron
10 sulfate, which are necessary for growth. Finally, essential growth substances, such as amino acids and vitamins, can be employed in addition to the abovementioned substances. Suitable precursors can moreover be added to the culture medium. The starting substances mentioned can
15 be added to the culture in the form of a single batch, or can be fed in during the culture in a suitable manner.

Basic compounds, such as sodium hydroxide, potassium hydroxide, ammonia or aqueous ammonia, or acid compounds, such as phosphoric acid or sulfuric acid, can be employed
20 in a suitable manner to control the pH. Antifoams, such as e.g. fatty acid polyglycol esters, can be employed to control the development of foam. Suitable substances having a selective action, e.g. antibiotics, can be added to the medium to maintain the stability of plasmids. To
25 maintain aerobic conditions, oxygen or oxygen-containing gas mixtures, such as e.g. air, are introduced into the culture. The temperature of the culture is usually 25°C to 45°C, and preferably 30°C to 40°C. Culturing is continued until a maximum of L-threonine has formed. This target is
30 usually reached within 10 hours to 160 hours.

The analysis of L-threonine can be carried out by anion exchange chromatography with subsequent ninhydrin derivatization, as described by Spackman et al. (Analytical Chemistry, 30, (1958), 1190), or it can take place by
35 reversed phase HPLC as described by Lindroth et al. (Analytical Chemistry (1979) 51: 1167-1174).

The following microorganism has been deposited at the Deutsche Sammlung für Mikroorganismen und Zellkulturen (DSMZ = German Collection of Microorganisms and Cell Cultures, Braunschweig, Germany) in accordance with the Budapest

5 Treaty:

- *Brevibacterium flavum* strain DM368-2 pZlthrE as DSM 12840

The plasmid pZlthrE contains the thrE gene of *Corynebacterium glutamicum* ATCC13032.

- 10 The present invention is explained in more detail in the following with the aid of embodiment examples.

The isolation of plasmid DNA from *Escherichia coli* and all techniques of restriction, Klenow and alkaline phosphatase treatment were carried out by the method of Sambrook et al.

- 15 (Molecular cloning - A laboratory manual (1989) Cold Spring Harbour Laboratory Press). The transformation of *Escherichia coli* was carried out by the method of Chung et al. (Proceedings of the National Academy of Sciences of the United States of America USA (1989) 86: 2172-2175).

- 20 The incubation temperature during the preparation of *E. coli* strains and transformants was 37°C. In the gene replacement process of Hamilton et al. (Journal of Bacteriology (1989) 171: 4617-4622) temperatures of 30°C and 44°C were used.

25 Example 1

Cloning and sequencing of the thrE gene of *Corynebacterium glutamicum* ATCC14752

1. Transposon mutagenesis and mutant selection

- The strain *Corynebacterium glutamicum* ATCC14752ΔilvA was
30 subjected to mutagenesis with the transposon Tn5531, the sequence of which is deposited under accession number U53587 in the nucleotide databank of the National Center

for Biotechnology Information (Bethesda, USA). The incorporation of a deletion in the *ilvA* gene of *Corynebacterium glutamicum* ATCC14752 was carried out with the gene exchange system described by Schäfer et al. (Gene 5 (1994) 145: 69-73). For this, an inactivation vector pK19mobsacB Δ *ilvA* constructed by Sahm et al. (Applied and Environmental Microbiology (1999) 65: 1973-1979) was used for the deletion. The methylase-defective *Escherichia coli* strain SCS110 (Jerpseth and Kretz, STRATEGIES in molecular 10 biology 6, 22, (1993)) from Stratagene (Heidelberg, Germany) was first transformed with 200 ng of the vector pK19mobsacB Δ *ilvA*. Transformants were identified with the aid of their kanamycin resistance on LB agar plates containing 50 μ g/mL kanamycin. The plasmid pK19mobsacB Δ *ilvA* 15 was prepared from one of the transformants. By means of electroporation (Haynes et al., FEMS Microbiology Letters (1989) 61: 329-334), this inactivation plasmid was then introduced into the strain *Corynebacterium glutamicum* ATCC14752. Clones in which the inactivation vector was 20 present integrated in the genome were identified with the aid of their kanamycin resistance on LBHIS agar plates containing 15 μ g/mL kanamycin (Liebl et al., FEMS Microbiology Letters (1989) 65: 299-304). To select for the excision of the vector, kanamycin-resistant clones were 25 plated out on sucrose-containing LBG medium (LB medium with 15 g/L agar, 2% glucose and 10% sucrose). This gave colonies which have lost the vector again by a second recombination event (Jäger et al.; Journal of Bacteriology (1992) 174: 5462-5465). By transinoculation on to minimal 30 medium plates (CGXII medium with 15 g/L Agar (Keilhauer et al., Journal of Bacteriology (1993) 175: 5595-5603)) with and without 300 mg/L L-isoleucine, or with and without 50 μ g/mL kanamycin, six clones were isolated which were kanamycin-sensitive and isoleucine-auxotrophic due to 35 excision of the vector and in which the incomplete *ilvA* gene (Δ *ilvA* allele) was now present in the genome. One of these clones was designated strain ATCC14752 Δ *ilvA* and employed for the transposon mutagenesis.

From the methylase-defective *E. coli* strain GM2929pCGL0040 (*E. coli* GM2929: Palmer et al., Gene (1994) 143: 1-12) was isolated the plasmid pCGL0040 (figure 1), which contains the combined transposon Tn5531 (Ankri et al., Journal of Bacteriology (1996) 178: 4412-4419). The strain *Corynebacterium glutamicum* ATCC14752 Δ ilvA was transformed by means of electroporation (Haynes et al., FEMS Microbiology Letters (1989) 61: 329-334) with the plasmid pCGL0040. Clones in which the transposon Tn5531 was integrated into the genome were identified with the aid of their kanamycin resistance on LBHIS agar plates containing 15 μ g/mL kanamycin (Liebl et al., FEMS Microbiology Letters (1989) 65: 299-304). 2000 clones were obtained in this manner, and were investigated for delayed growth in the presence of threonyl-threonyl-threonine. For this, all the clones were transferred individually to CGXII minimal medium agar plates with and without 2 mM threonyl-threonyl-threonine. The medium was identical to the CGXII medium described by Keilhauer et al. (Journal of Bacteriology (1993) 175: 5593-5603), but additionally contained 25 μ g/mL kanamycin, 300 mg/L L-isoleucine and 15 g/L agar. The composition of the medium described by Keilhauer et al. is shown in table 1.

Table 1

Composition of the CGXII medium

Component	Concentration
(NH ₄) ₂ SO ₄	20 g/L
Urea	5 g/L
KH ₂ PO ₄	1 g/L
K ₂ HPO ₄	1 g/L
MgSO ₄ x 7 H ₂ O	0.25 g/L
3-Morpholinopropanesulfonic acid	42 g/L
CaCl ₂	10 mg/L
FeSO ₄ x 7 H ₂ O	10 mg/L
MnSO ₄ x H ₂ O	10 mg/L
ZnSO ₄ x 7H ₂ O	1 mg/L

CuSO ₄	0.2 mg/L
NiCl ₂ x 6 H ₂ O	0.02 mg/L
Biotin	0.2 mg/L
Glucose	40 g/L
Protocatechuic acid	30 mg/L

The agar plates were incubated at 30°C and the growth was investigated after 12, 18 and 24 hours. A transposon mutant was obtained which grew in a manner comparable to the starting strain *Corynebacterium glutamicum* ATCC14752ΔilvA without threonyl-threonyl-threonine but showed delayed growth in the presence of 2 mM threonyl-threonyl-threonine. This was designated ATCC14752ΔilvAthrE::Tn5531.

2. Cloning and sequencing of the insertion site of Tn5531 in ATCC14752ΔilvAthrE::Tn5531

To clone the insertion site lying upstream of the transposon Tn5531 in the mutant described in example 1.1, the chromosomal DNA of this mutant strain was first isolated as described by Schwarzer et al. (Bio/Technology (1990) 9: 84-87) and 400 ng thereof were cleaved with the restriction endonuclease EcoRI. The complete restriction batch was ligated in the vector pUC18 (Norander et al., Gene (1983) 26: 101-106, Roche Diagnostics, (Mannheim, Germany), which was also linearized with EcoRI. The *E. coli* strain DH5αmcr (Grant et al., Proceedings of the National Academy of Sciences of the United States of America USA (1990) 87: 4645-4649) was transformed with the entire ligation batch by means of electroporation (Dower et al., Nucleic Acid Research (1988) 16: 6127-6145). Transformants in which the insertion sites of the transposon Tn5531 were present cloned on the vector pUC18 were identified with the aid of their carbenicillin and kanamycin resistance on LB agar plates containing 50 µg/mL carbenicillin and 25 µg/mL kanamycin. The plasmids were prepared from three of the transformants and the sizes of

- the cloned inserts were determined by restriction analysis. The nucleotide sequence of the insertion site on one of the plasmids with an insert approx. 5.7 kb in size was determined by the dideoxy chain termination method of Sanger et al. (Proceedings of the National Academy of Sciences of the United States of America USA (1977) 74: 5463-5467). For this, 2.2 kb of the insert were sequenced starting from the following oligonucleotide primer: 5'-CGG GTC TAC ACC GCT AGC CCA GG-3'.
- 10 For identification of the insertion site lying downstream of the transposon, the chromosomal DNA of the mutant was cleaved with the restriction endonuclease XbaI and ligated in the vector pUC18 linearized with XbaI. Further cloning was carried out as described above. The nucleotide
- 15 sequence of the insertion site on one of the plasmids with an insert approx. 8.5 kb in size was determined by the dideoxy chain termination method of Sanger et al. (Proceedings of the National Academy of Sciences of the United States of America USA (1977) 74: 5463-5467). For
- 20 this, 0.65 kb of the insert were sequenced starting from the following oligonucleotide primer: 5'-CGG TGC CTT ATC CAT TCA GG-3'.

- The nucleotide sequences obtained were analysed and joined together with the Lasergene program package (Biocomputing Software for Windows, DNASTAR, Madison, USA)). This
- 25 nucleotide sequence is reproduced as SEQ ID NO 1. The result of the analysis was identification of an open reading frame of 1467 bp in length. The corresponding gene was designated the thrE gene. The associated gene product
- 30 comprises 489 amino acids and is reproduced as SEQ ID NO 2.

Example 2

Cloning and sequencing of the thrE gene from
Corynebacterium glutamicum ATCC13032

- The thrE gene was cloned in the *E. coli* cloning vector
- 35 pUC18 (Norranders et al., Gene (1983) 26: 101-106, Roche

Diagnostics, Mannheim, Germany). The cloning was carried out in two steps. The gene from *Corynebacterium glutamicum* ATCC13032 was first amplified by a polymerase chain reaction (PCR) by means of the following oligonucleotide
5 primers derived from SEQ ID NO 1.

thrE-forward:

5'-CCC CTT TGA CCT GGT GTT ATT G-3'.

thrE-reverse:

5'-CGG CTG CGG TTT CCT CTT-3'

- 10 The PCR reaction was carried out in 30 cycles in the presence of 200 μ M deoxynucleotide triphosphates (dATP, dCTP, dGTP, dTTP), in each case 1 μ M of the corresponding oligonucleotide, 100 ng chromosomal DNA from *Corynebacterium glutamicum* ATCC13032, 1/10 volume 10-fold
15 reaction buffer and 2.6 units of a heat-stable Taq-/Pwo-DNA polymerase mixture (Expand High Fidelity PCR System from Roche Diagnostics, Mannheim, Germany) in a Thermocycler (PTC-100, MJ Research, Inc., Watertown, USA) under the following conditions: 94°C for 30 seconds, 58°C for 30
20 seconds and 72°C for 2 minutes.

- The amplified fragment about 1.9 kb in size was then subsequently ligated with the aid of the SureClone Ligation Kit (Amersham Pharmacia Biotech, Uppsala, Sweden) into the SmaI cleavage site of the vector pUC18 in accordance with
25 the manufacturer's instructions. The *E. coli* strain DH5 α mc^r (Grant et al., Proceedings of the National Academy of Sciences of the United States of America USA (1990) 87: 4645-4649) was transformed with the entire ligation batch. Transformants were identified with the aid of their
30 carbenicillin resistance on LB agar plates containing 50 μ g/mL carbenicillin. The plasmids were prepared from 8 of the transformants and checked for the presence of the 1.9 kb PCR fragment as an insert by restriction analysis.

The recombinant plasmid formed in this way is designated pUC18thrE in the following.

The nucleotide sequence of the 1.9 kb PCR fragment in plasmid pUC18thrE was determined by the dideoxy chain
5 termination method of Sanger et al. (Proceedings of the National Academy of Sciences of the United States of America USA (1977) 74: 5463-5467). For this, the complete insert of pUC18thrE was sequenced with the aid of the following primers from Roche Diagnostics (Mannheim,
10 Germany).

Universal primer:

5'-GTA AAA CGA CGG CCA GT-3'

Reverse primer:

5'-GGA AAC AGC TAT GAC CAT G-3'

15 The nucleotide sequence is reproduced as SEQ ID NO 3. The nucleotide sequence obtained was analysed with the Lasergene program package (Biocomputing Software for Windows, DNASTAR, Madison, USA). The result of the analysis was identification of an open reading frame of
20 1467 bp in length, which was designated the thrE gene. This codes for a polypeptide of 489 amino acids, which is reproduced as SEQ ID NO 4.

Example 3

Expression of the thrE gene in *Corynebacterium glutamicum*

25 The thrE gene from *Corynebacterium glutamicum* ATCC13032 described under example 2 was cloned for expression in the vector pZ1 (Menkel et al., Applied and Environmental Microbiology (1989) 64: 549-554). For this, a DNA fragment 1881 bp in size which contained the thrE gene was cut out
30 of the plasmid pUC18thrE with the restriction enzymes SacI and XbaI. The 5' and 3' ends of this fragment were treated with Klenow enzyme. The resulting DNA fragment was ligated

in the vector pZ1, which was linearized with ScaI and dephosphorylated beforehand. The *E. coli* strain DH5 α mc^r (Grant et al., Proceedings of the National Academy of Sciences of the United States of America USA (1990) 87: 4645-4649) was transformed with the entire ligation batch. Transformants were identified with the aid of their kanamycin resistance on LB agar plates containing 50 μ g/mL kanamycin. The plasmids were prepared from 2 transformants and checked for the presence of the 1881 bp ScaI/XbaI fragment as an insert by restriction analysis. The recombinant plasmid formed in this manner was designated pZ1thrE (figure 2).

By means of electroporation (Haynes et al., FEMS Microbiology Letters (1989) 61: 329-334), the plasmid pZ1thrE was introduced into the threonine-forming strain *Brevibacterium flavum* DM368-2. The strain DM368-2 is described in EP-B-0 385 940 and deposited as DSM5399. Transformants were identified with the aid of their kanamycin resistance on LBHIS agar plates containing 15 μ g/mL kanamycin (Liebl et al., FEMS Microbiology Letters (1989) 65: 299-304). The strain *Brevibacterium flavum* DM368-2 pZ1thrE was formed in this manner.

Example 4

Construction of the expression plasmid pTrc99AthrE

The thrE gene from *Corynebacterium glutamicum* ATCC13032 described under example 2 was cloned for expression in *Escherichia coli* in the vector pTrc99A, which was obtained from Pharmacia Biotech (Uppsala, Sweden), for expression in *Escherichia coli*. For this, the plasmid pUC18thrE was cleaved with the enzyme SalI and the projecting 3' ends were treated with Klenow enzyme. After restriction with the enzyme KpnI, the cleavage batch was separated in 0.8% agarose gel and the thrE fragment 1.9 kbp in size was isolated with the aid of the QIAquick Gel Extraction Kit (QIAGEN, Hilden, Germany). The vector pTrc99A was cleaved with the enzyme EcoRI, the 3' ends were treated with Klenow

enzyme, cleaved with the enzyme KpnI and ligated with the thrE fragment isolated. The ligation batch was transformed in the E. coli strain DH5 α . Selection of cells carrying pTrc99A was carried out on LB agar (Lennox, Virology 1:190 5 (1955)), to which 50 μ g/ml ampicillin had been added. Successful cloning of the thrE gene could be demonstrated after plasmid DNA isolation and control cleavage with XbaI, BamHI, EcoRI, HindIII and SspI. The plasmid was designated pTrc99AthrE (figure 3).

10 Example 5

Preparation of L-threonine with the strain MG442/pTrc99AthrE

The L-threonine-producing E. coli strain MG442 is described in the patent specification US-A- 4,278,765 and deposited 15 at the Russian National Collection of Industrial Microorganisms (VKPM, Moscow, Russia) as CMIM B-1628.

The strain MG442 was transformed with the plasmid pTrc99AthrE and plasmid-carrying cells were selected on LB agar with 50 μ g/ml ampicillin. Selected individual 20 colonies were then multiplied further on minimal medium with the following composition: 3.5 g/l Na₂HPO₄*2H₂O, 1.5 g/l KH₂PO₄, 1 g/l NH₄Cl, 0.1 g/l MgSO₄*7H₂O, 2 g/l glucose, 20 g/l agar, 50 mg/l ampicillin. The formation of L-threonine was checked in batch cultures of 10 ml 25 contained in 100 ml conical flasks. For this, 10 ml preculture medium of the following composition: 2 g/l yeast extract, 10 g/l (NH₄)₂SO₄, 1 g/l KH₂PO₄, 0.5 g/l MgSO₄*7H₂O, 15 g/l CaCO₃, 20 g/l glucose, 50 mg/l ampicillin were inoculated and incubated for 16 hours at 37°C and 180 rpm 30 on an ESR incubator from Kühner AG (Birsfelden, Switzerland). 250 μ l portions of this preculture were transinoculated into 10 ml of production medium (25 g/l (NH₄)₂SO₄, 2 g/l KH₂PO₄, 1 g/l MgSO₄*7H₂O, 0.03 g/l FeSO₄*7H₂O, 0.018 g/l MnSO₄*1H₂O, 30 g/l CaCO₃, 20 g/l 35 glucose) and the mixtures were incubated for 48 hours at 37°C. For induction of the expression of the thrE gene,

200 mg/l isopropyl β -D-thiogalactoside (IPTG) were added in parallel batches. After the incubation, the optical density (OD) of the culture suspension was determined with an LP2W photometer from Dr. Lange (Berlin, Germany) at a measurement wavelength of 660 nm.

The concentration of L-threonine formed was then determined in the sterile-filtered culture supernatant with an amino acid analyser from Eppendorf-BioTronik (Hamburg, Germany) by ion exchange chromatography and post-column reaction with ninhydrin detection.

The result of the experiment is shown in table 2.

Table 2

Strain	Additives	OD	L-Threonine g/l
MG442	-	5.6	1.38
MG442/pTrc99AthrE	-	4.6	1.65
MG442/pTrc99AthrE	IPTG	3.6	3.5

Example 6

- 15 Preparation of L-threonine with the strain
B-3996kurAtdh/pVIC40, pMW218thrE

The L-threonine-producing E. coli strain B-3996 is described in US-A- 5,175,107 and deposited at the Russian National Collection for Industrial Microorganisms (VKPM,
20 Moscow, Russia).

6.1 Cloning of the thrE gene in the plasmid vector pMW218

The plasmid pTrc99AthrE described under example 4 was cleaved with the enzyme SspI, the cleavage batch was separated in 0.8% agarose gel and the DNA fragment 2.5 kbp

in size, which contained the trc promoter region and the rRNA terminator region in addition to the thrE gene, was isolated with the aid of the "QIAquick Gel Extraction Kit" (QIAGEN, Hilden, Germany). The plasmid pMW218 (Nippon Gene, Toyama, Japan) was cleaved with the enzyme SmaI and ligated with the thrE fragment. The E. coli strain DH5 α was transformed with the ligation batch and pMW218-carrying cells were selected by plating out on LB agar, to which 20 μ g/ml kanamycin are added. Successful cloning of the thrE gene could be demonstrated after plasmid DNA isolation and control cleavage with HindIII and ClaI. The plasmid was designated pMW218thrE (figure 4).

6.2 Preparation of the strain B-3996kur Δ tdh/pVIC40, pMW218thrE

- After culture in antibiotic-free complete medium for approximately ten generations, a derivative of strain B-3996 which no longer contained the plasmid pVIC40 was isolated. The strain formed was streptomycin-sensitive and was designated B-3996kur.
- The method described by Hamilton et al. (Journal of Bacteriology (1989) 171: 4617-4622), which is based on the use of the plasmid pMAK705 with a temperature-sensitive replicon, was used for incorporation of a deletion into the tdh gene. The plasmid pDR121 (Ravnikar and Somerville, Journal of Bacteriology (1987) 169: 4716-4721) contains a DNA fragment from E. coli 3.7 kilo-base pairs (kbp) in size, on which the tdh gene is coded. To generate a deletion of the tdh gene region, pDR121 was cleaved with the restriction enzymes ClaI and EcoRV and the DNA fragment 5 kbp in size isolated was ligated, after treatment with Klenow enzyme. The ligation batch was transformed in the E. coli strain DH5 α and plasmid-carrying cells were selected on LB agar, to which 50 μ g/ml ampicillin are added.
- Successful deletion of the tdh gene could be demonstrated after plasmid DNA isolation and control cleavage with

EcoRI. The EcoRI fragment 1.7 kbp in size was isolated, and ligated with the plasmid pMAK705, which was partly digested with EcoRI. The ligation batch was transformed in DH5 α and plasmid-carrying cells were selected on LB agar, 5 to which 20 μ g/ml chloramphenicol were added. Successful cloning was demonstrated after isolation of the plasmid DNA and cleavage with EcoRI. The pMAK705 derivative formed was designated pDM32.

For the gene replacement, B-3996kur was transformed with 10 the plasmid pDM32. The replacement of the chromosomal tdh gene with the plasmid-coded deletion construct was carried out by the selection process described by Hamilton et al. and was verified by standard PCR methods (Innis et al. (1990), PCR Protocols. A Guide to Methods and Applications, 15 Academic Press) with the following oligonucleotide primers:

Tdh1: 5'-TCGCGACCTATAAGTTTGGG-3'

Tdh2: 5'-AATACCAGCCCTTGTTCTGTG-3'

The strain formed was tested for kanamycin sensitivity and was designated B-3996kur Δ tdh.

20 B-3996kur Δ tdh was transformed with the plasmid pVIC40 isolated from B-3996 and plasmid-carrying cells were selected on LB agar supplemented with 20 μ g/ml streptomycin. A selected individual colony was designated B-3996kur Δ tdh/pVIC40 and transformed with the plasmid 25 pMW218thrE. Selection is carried out on LB-agar to which 20 μ g/ml streptomycin and 50 μ g/ml kanamycin are added. The strain formed in this way was designated B-3996kur Δ tdh/pVIC40, pMW218thrE.

6.3 Preparation of L-threonine

30 The preparation of L-threonine by the strains B-3996kur Δ tdh/pVIC40 and B-3996kur Δ tdh/pVIC40, pMW218thrE was tested as described in example 5. The minimal medium, the preculture medium and the production medium were supplemented with 20 μ g/ml streptomycin for

B-3996kur Δ tdh/pVIC40 and with 20 μ g/ml streptomycin and 50 μ g/ml kanamycin for B-3996kur Δ tdh/pVIC40, pMW218thrE.

The result of the experiment is summarized in table 3.

Table 3

Strain	OD (660 nm)	L-Threonine g/l
B-3996kur Δ tdh/pVIC40	4.7	6.26
B-3996kur Δ tdh/pVIC40, pMW218thrE	4.8	7.57

5

The following figures are attached:

- Figure 1: Map of the plasmid pCGL0040 containing the transposon Tn5531. The transposon is identified as the non-shaded arrow.
- 5 • Figure 2: Map of the plasmid pZ1thrE containing the thrE gene.
- Figure 3: Map of the plasmid pTrc99AthrE containing the thrE gene.
- Figure 4: Map of the plasmid pMW218thrE containing the
10 thrE gene

The length data are to be understood as approx. data. The abbreviations and designations used have the following meaning:

- Amp: Ampicillin resistance gene
- 15 • Kan: Kanamycin resistance gene
- 'amp: 3' part of the ampicillin resistance gene
- oriBR322: Replication region of the plasmid pBR322
- lacI: Gene for the repressor protein of the trc promoter
- 20 • P_{trc}: trc promoter region, IPTG-inducible
- 5S: 5S rRNA region
- rrnBT: rRNA terminator region

The abbreviations for the restriction enzymes have the following meaning.

- 25 • BamHI: Restriction endonuclease from *Bacillus amyloliquefaciens*
- BglII: Restriction endonuclease from *Bacillus globigii*

- ClaI: Restriction endonuclease from *Caryophanon latum*
- EcoRI: Restriction endonuclease from *Escherichia coli*
- EcoRV: Restriction endonuclease from *Escherichia coli*
- HindIII: Restriction endonuclease from *Haemophilus*
5 *influenzae*
- KpnI: Restriction endonuclease from *Klebsiella*
 pneumoniae
- PstI: Restriction endonuclease from *Providencia stuartii*
- PvuI: Restriction endonuclease from *Proteus vulgaris*
- 10 • SacI: Restriction endonuclease from *Streptomyces*
 achromogenes
- SalI: Restriction endonuclease from *Streptomyces albus*
- SmaI: Restriction endonuclease from *Serratia marcescens*
- XbaI: Restriction endonuclease from *Xanthomonas badrii*
- 15 • XhoI: Restriction endonuclease from *Xanthomonas*
 holcicola

Patent claims

1. A process for the fermentative preparation of L-threonine, which comprises employing
5 Enterobacteriaceae bacteria, in particular those which already produce L-threonine and in which the nucleotide sequence(s) of coryneform bacteria which code(s) for the thrE gene are enhanced, in particular over-expressed.
- 10 2. A process as claimed in claim 1, wherein further genes are enhanced in addition to the thrE gene.
3. A process as claimed in claim 1 or 2, wherein the microorganisms of the family Enterobacteriaceae are from the genus Escherichia and Serratia.
- 15 4. A process as claimed in claim 3, wherein the microorganisms are from the genus Escherichia , in particular of the species Escherichia coli.
5. A process as claimed in claim 1, wherein the thrABC operon which codes for aspartate kinase, homoserine
20 dehydrogenase, homoserine kinase and threonine synthase is enhanced at the same time.
6. A process as claimed in claim 1, wherein the pyc gene which codes for pyruvate carboxylase is enhanced at the same time.
- 25 7. A process as claimed in claim 1, wherein the pps gene which codes for phosphoenol pyruvate synthase is enhanced at the same time.
8. A process as claimed in claim 1, wherein the ppc gene which codes for phosphoenol pyruvate carboxylase is
30 enhanced at the same time.

9. A process as claimed in claim 1, wherein the genes pntA and pntB which code for transhydrogenase are enhanced at the same time.
10. A process as claimed in claim 1, wherein bacteria in which the metabolic pathways which reduce the formation of L-threonine are at least partly eliminated are employed.
11. A process as claimed in claim 1, wherein a strain transformed with a plasmid vector is employed and the plasmid vector carries the nucleotide sequence which codes for the thrE gene of coryneform bacteria.
12. A process as claimed in claim 1, wherein bacteria transformed with the plasmid pZ1thrE are employed.
13. A process as claimed in claim 1, wherein the expression of the thrE gene is induced, in particular with isopropyl β -D-thiogalactoside.
14. A process as claimed in claim 1, wherein the gdhA gene which codes for glutamate dehydrogenase is enhanced at the same time.
15. A process as claimed in claim 1, wherein the rhtB gene which imparts homoserine resistance is enhanced at the same time.
16. A process for the preparation of L-threonine, which comprises carrying out the following steps:
 - a) fermentation of microorganisms of the family Enterobacteriaceae in which at least the thrE gene of coryneform bacteria is enhanced (over-expressed), optionally in combination with further genes,
 - b) concentration of the L-threonine in the medium or in the cells of the microorganisms of the family Enterobacteriaceae, and

c) isolation of the L-threonine.

17. The plasmid pZ1thrE which contains the thrE gene of *Corynebacterium glutamicum* ATCC13032.
18. The *Brevibacterium flavum* strain DM368-2 pZ1thrE
5 deposited as DSM 12840 at the DSMZ [German Collection
of Microorganisms and Cell Cultures], Braunschweig.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/EP 01/03980

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 C12N15/70 C12N15/77 C12P13/08 C12N1/21 //C12N15/31

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 7 C12N C12P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, SEQUENCE SEARCH, WPI Data, PAJ, MEDLINE, CAB Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P, X	EP 1 085 091 A (DEGUSSA ;KERNFORSCHUNGSANLAGE JUELICH (DE)) 21 March 2001 (2001-03-21) the whole document ---	1-6, 10-13, 16-18
A	WO 98 04715 A (ARCHER DANIELS MIDLAND CO) 5 February 1998 (1998-02-05) the whole document ---	
A	WO 99 53035 A (ALTMAN ELLIOT ;GOKARN RAVI R (US); EITEMAN MARK A (US); UNIV GEORG) 21 October 1999 (1999-10-21) the whole document ---	
	--- -/--	

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the International filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- *G* document member of the same patent family

Date of the actual completion of the international search

2 October 2001

Date of mailing of the international search report

10/10/2001

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
NL - 2280 HV Rijswijk
Tel. (+31-70) 340-2040, Tx. 31 651 epo nl,
Fax (+31-70) 340-3016
